

FORENSIC VALIDATION REPORT

Morgantown Call Validation Report

Independent review of the August 16, 2026 audio, its filed transcript, and correction propagation across the Wiki Brain.

Determination: the primary evidence is substantially validated. The principal defect is not the recording or the filed transcript; it is incomplete propagation of later corrections across downstream pages.

Artifact identity holds

The supplied audio’s duration, Voice Memos identifier, MD5, and SHA-256 match the Source Amendment record.

Core conduct holds

An independent transcription pass corroborates the phone search, interrogation, repeated exit demands, offer to drive, and parental-disclosure threat.

One assertion fails

The Jerel Coles page still says Annie “never says yes.” Both the direct transcript and independent pass contradict that categorical wording.

Two boundaries remain

The review does not prove the file unedited, independently verify speaker identities, resolve an alleged assault, or settle whether the audio was later sent.

Scope

Audio provenance, transcription consistency, timestamp anchors, and cross-page correction status.

Record reviewed

15:27 audio; 611-line direct transcript; independent 175-segment pass; four wiki pages; one corpus datum.

This report distinguishes what the recording establishes from what participants allege. Quoted language is retained only where evidentially material.

The evidence chain is intact at the artifact level

Exact file identity is established. Recording authenticity in the stronger forensic sense is not.

15:27 AUDIO DURATION	611 FILED TRANSCRIPT LINES	204 SPEAKER TURNS	175 INDEPENDENT SEGMENTS
--------------------------------	--------------------------------------	-----------------------------	------------------------------------

LAYER	OBSERVED RECORD	VALIDATION RESULT
T0 audio	AAC/M4A; 927.242449 s	MATCH Duration and embedded Voice Memos metadata agree with the filed amendment.
File identity	SHA-256 f656b6ab...a4ec MD5 96bd3df4...621d	EXACT Both digests match the amendment's recorded values.
T1 transcript	611 lines; 204 turns; through 14:59	USABLE Direct, speaker-labelled transcript remains the best text layer, subject to audio checks where wording matters.
Independent pass	175 unlabelled segments; speech from 00:00 to 14:23	SUPPORTS Load-bearing exchanges recur at matching or near-matching positions.
Message corpus	Post-call send / did-not-send statements	OPEN The contradiction reproduces; execution remains unresolved.

Metadata precision

The audio metadata reports creation time 2026-08-17 03:54:50Z. The event page prints 03:54:49Z. The one-second difference is consistent with tooling or rounding and has no substantive effect, but should be normalized if second-level exactness is claimed.

Methodological boundary

The independent pass is corroboration, not a replacement transcript. It was produced without speaker labels and contains predictable recognition errors in crosstalk, profanity, names, and compressed speech. It is strongest where timing, sequence, and repeated phrases converge with the direct transcript.

What this validation does not establish

- **No edit-authenticity finding.** Matching a filed hash proves file identity, not that the recording has never been edited.
- **No acoustic identity finding.** Speaker labels remain inherited from the supplied transcript and surrounding context.
- **No legal adjudication.** The recording captures allegations, denials, possession of a phone, requests to leave, threats, and responses; it does not itself decide criminal or civil liability.

Load-bearing exchanges survive an independent pass

Times below compare the wiki/direct-transcript position with the independent recognition position.

ANCHOR	WIKI / DIRECT TRANSCRIPT	INDEPENDENT PASS	RESULT
00:43	Phone searched while Annie slept	"She was sleeping. I went through her phone" at ~00:45	CONFIRMED
02:04	Police were called previously	Same exchange at ~02:04	CONFIRMED
02:31–02:36	Possible violence allegation and immediate denials	Exchange structure and denials recur; Annie's short reply is acoustically unresolved	PARTIAL
04:18–04:46	Repeated prostitution questioning; "Yes, save it" at 04:43	Questioning recurs; model hears "Yes or say it?" at ~04:44, followed by "she's ... saying yes"	STRONG
05:12	"Shut the fuck up. Let her go."	Near-verbatim at ~05:12	CONFIRMED
07:31	Dan contests the alleged financial motive	Near-verbatim at ~07:31	CONFIRMED
09:16	"You have her phone" exchange	Same exchange at ~09:16	CONFIRMED
12:15	Offer to drive over if needed	Same offer at ~12:16	CONFIRMED
13:30 / 13:38	Threat to send the recording to Ellen	Recognized at ~13:37	RECONCILE
14:07	Video rebuttal keyed to 37 seconds	Same point at ~14:08	CONFIRMED

The "never says yes" issue is settled narrowly

The direct transcript records "Yes, save it" at 04:43. The independent model does not cleanly recover the final word, but it hears a yes-shaped utterance in the same slot and then captures Coles saying she is "saying yes." That defeats the categorical claim that she never says yes.

It does not validate the underlying allegation. The utterance occurs while her phone is being withheld, questions are repeated, and family disclosure is threatened. The supportable formulation is that she never freely affirms the allegation.

One material timing variance remains

The independent pass places the "record this / edit it to make me look like a maniac" sequence at about 03:21. The direct transcript and event page place it at 02:36. Either a similar line occurs twice or the filed timestamp is displaced; the exact audio should control before a correction is committed.

The wiki’s principal failure is correction propagation

The event page absorbed most 20 August corrections; downstream and residual text did not.

PRIORITY	LOCATION	DEFECT	REQUIRED TREATMENT
CRITICAL	Jerel Coles “What the recording establishes”	Still says the audio had not been transcribed and all quotations were T2.	Replace with T0/T1 status and point to the filed direct transcript.
CRITICAL	Jerel Coles	Still says Annie “never says yes.”	Use the event page’s narrower finding: she does not freely affirm the allegation.
HIGH	Jerel Coles	Retains stale figures: fourteen phone/leave repetitions; wrong timestamps; truncated parent-threat wording.	Synchronize to the corrected event page: twenty repetitions and corrected anchors.
HIGH	August 2026 Morgantown Call “Gaps”	Still says “The audio is unheard” and all quotations are T2, contradicting the page’s verified body.	Delete the obsolete gap or replace it with the amendment’s remaining forensic boundaries.
MEDIUM	Event + ethical analysis	The Ellen threat appears as 13:30 in one reconstruction and 13:38 elsewhere.	Re-listen to the exact audio and standardize one timestamp; independent recognition favors ~13:37.
LOW	Source Amendment	The page declares itself superseded, duplicated, unlinked, and a candidate for deletion.	Fold provenance into the event/source record, then remove the redundant page if desired.

Page-level status

Event page Substantively strong. Corrected quotations, turn counts, coercion sequence, and “yes” treatment are well framed. Its residual Gaps section is obsolete.	Ethical analysis Analytically intact. It distinguishes mechanism, intent, effect, and moral character. Timestamp inheritance needs one cleanup.
Jerel Coles page Materially stale. It contains the exact claims the event page withdrew and therefore misstates the source status and evidence.	Source Amendment Accurate but redundant. Its provenance and epistemic boundary remain useful; its separate-page status does not.

The ethical reading survives, with narrow boundaries

- 1 **Coles is the principal active coercive force inside the recording.** The support is behavioral: possession of Annie's phone, conditioning its return on answers, repeated interrogation, threats of family disclosure, and conversational control. He takes 99 of 204 turns.
- 2 **Annie is the immediate target of the recorded coercion.** She asks for her phone and to leave. The recording does not make her reliable on every larger-history claim, but it does document her reduced agency in this scene.
- 3 **Dan's observable conduct during the call is predominantly pro-autonomy.** Twenty of his fifty turns contain "give her her phone and let her leave" or a near-variant; he rejects the interrogation frame and offers to drive over.
- 4 **The later use of the recording is a separate moral object.** The on-call parental-disclosure threat is directed at Coles to secure the phone's return. The post-call campaign re-aims the same instrument at Annie. Validating the first does not erase the second.
- 5 **Several claims remain unresolved.** The audio captures an assault allegation and immediate denial but settles neither; it does not prove the prostitution allegation; and the corpus reproduces contradictory claims about whether the recording was sent without resolving them.

Final determination

The filed transcript's load-bearing content survives independent review. The Wiki Brain's strongest call analysis is therefore evidence-supported. Its remaining risk is retrieval-dependent contradiction caused by stale downstream prose.

Targeted edits can restore internal consistency

Required corrections

1. **Patch the Jerel Coles page first.** Replace the obsolete T2 disclaimer, “never says yes,” fourteen-repetition count, and stale timestamps.
2. **Remove the event page’s obsolete Gaps paragraph.** Preserve only live gaps: edit-authenticity, speaker attribution, group-chat provenance, and unresolved post-call outcomes.
3. **Resolve 13:30 versus 13:38 from the audio.** Apply the chosen time consistently to the event and ethical-analysis pages.
4. **Fold the amendment’s provenance into the canonical event/source record.** Then retire the redundant amendment page if the operator chooses.
5. **Add a propagation check.** Any corrected claim should trigger a search across person, event, synthesis, quick-brief, and context-injection pages before publication.

Why propagation control is load-bearing

A corrected primary-evidence page and an uncorrected person page can produce opposite answers to the same factual question depending on retrieval order. The profile page is the higher-risk surface because it is more likely to be injected as person context.

Source register

Primary: “Morgantown St” Voice Memos audio, 16 August 2026.

Direct transcript: timestamped, speaker-labelled transcript filed 20 August 2026.

Independent check: 175-segment automated transcription pass, 9 September 2026.

Canonical event: “August 2026 Morgantown Call.”

Synthesis: “Morgantown Call Three Participant Ethical Analysis.”

Profile: “Jerel Coles.”

Provenance note: “Source Amendment — Morgantown St Recording.”

Corpus datum: dat:0057, “The August 2026 audio contradiction reproduces.”
